

Julian Moffett

Field CTO Financial Services

WHY POSTGRES IS
BECOMING THE
STANDARD IN
FINANCIAL SERVICES

OVERVIEW

AGENDA:

- Brief introduction to your host
- The rise of OSS and Postgres
- Running mission critical applications on OSS
- How EDB can help you succeed and scale
- Q&A

Julian Moffett: Field CTO Financial Services @EnterpriseDB

Description / Bio

Julian has 15+ years of experience working in the Financial Services sector in various different roles:

- **Infrastructure:** Engineering, Product and Service Management
- **Business Application** Delivery Lead
- **CTO / Enterprise Architect**

Most recently responsible for designing and building out enterprise scale Postgres managed services on premise and in cloud and program managing the large scale exit of incumbent database provider and the adoption of the new platforms.

Academically Julian comes from a Legal background (LLB, LPC) but has worked in technology all his professional career. Julian is TOGAF 9 certified.

Financial Services: Why Change, Typical Initiatives and Technology Impact

Drivers for Change¹

Remaining
Competitive

Reputation + **Talent**
attraction / retention

Desire to
improve **Agility**

Technology led/enabled
new Markets

Cost Reduction

Initiatives We See

- Application **Modernization**
- Process **Digitalization**
- Move to **Agile methodologies**
- Technology **Simplification** / Consolidation / Technical debt reduction
- EOL / Op **Risk Remediation**
- **Data Center** downsizing / consolidation

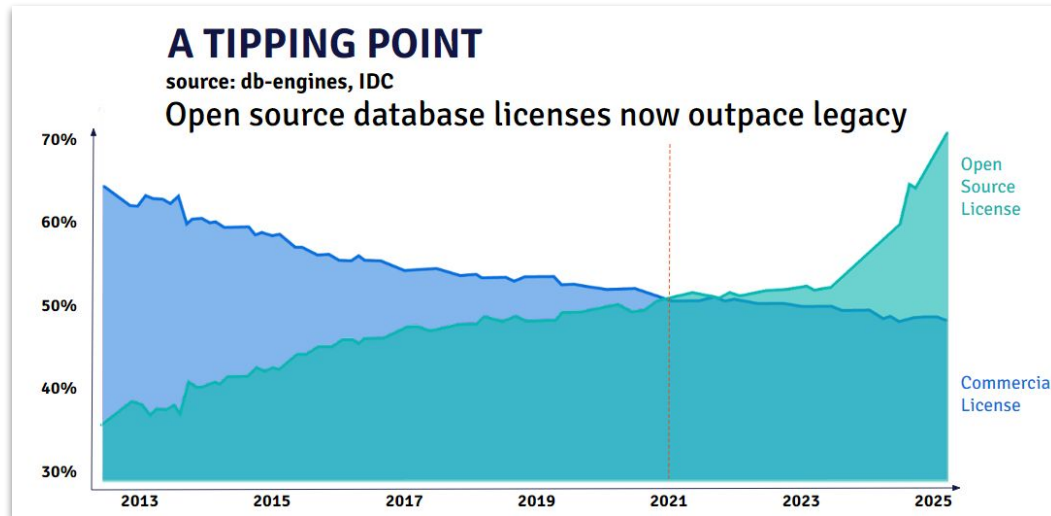

Implications on Technology Teams

- **Cloud + As a Service** Adoption
- Staff reskilling
 - **Rise of DEVOPS / IAC**
- Application **Refactoring**
 - Monolith deconstruction
 - The rise of **modularization** / microservices
 - **New technology** adoption
- Exit of incumbent vendors
 - **Enter OSS and Postgres!**

Open Source is mainstream and Postgres, the leader in the Database Space

- The **rise of Open Source** software is well documented
 - Many articles on global adoption across industries
[CNBC](#), [Forbes](#), [Techcrunch](#), [TechNewsWorld](#)

- Popularity of **proprietary database vendors in decline**

- **Postgres is hugely popular**

- DB-Engines.com, Cloud Native Computing Foundation (CNCF), Stackoverflow
- Cost is a factor but also flexibility, avoidance of lock-in
- No longer just for DEV. Applications in PROD run Postgres

Open Source and Postgres in Financial Services

- “Historically **banks have been hesitant** to adopt open source software” - [Finextra](#)

- **Times have changed!** From the same article above:

- “Significant Open Source company acquisitions by large established corporate tech-vendors”

Acquisition	Date	Amt.
SalesForce bought MuleSoft	Mar 2018	\$6.5B
Microsoft bought GitHub	Oct 2018	\$7.5B
IBM purchased RedHat	2019	\$34 B

- “...incumbent tech players are adopting a true open source strategy themselves. E.g. Microsoft...”

- Emergence of [FINOS](#): “...Open-Source Solutions for Financial Services”

- Accenture, [Goldman Sachs](#), JP Morgan, UBS, [Capital One](#), Fannie Mae, HSBC, Wells Fargo, RBC, [Deutsche Bank](#) +more

EDB in Financial Services

[ABN AMRO](#) Clearing is a recognized global leader in derivatives and equity clearing

[Mastercard](#) has long used PostgreSQL to support disaster recovery on its primary payment gateway, TNS

[ACI](#) - Global payments solutions processing more than \$14 trillion in payments + securities transactions daily

- Uses EDB’s BDR for multi-master replication for very high-availability across multiple geographies

Financial Services Enterprise Readiness

Not always a walk in the park...

Reliability

- Uptime! Requires HA / DR solutions to meet required RTO / RPO
- Support for Application Tiers up to Mission Critical. “Zero-downtime”
- Cross Availability Zone | Data center OR Cross Region

Performance

- Different workloads will have different e.g. TPS requirements
- Sizing the compute resources that the DB platform consumes is key

Scalability

- Repeatable deployment of 1000’s of databases requires orchestration and automation
- Monitor / operate / patch at scale

Security

- Data protection / encryption / redaction
- “need to know” data access and RBAC

and the elephant in the room...

Control requirements² on:

Control Topic
Authentication and Authorisation requirements
Access Management
Backup and Restore
Disaster Recovery Obligations
Infrastructure / DB Capacity Monitoring
IT Asset Management
Operational DB monitoring / alerting
Security Vulnerability / malware scanning
Security Patch management
Security Compliance Monitoring
Temporary Privileged Access Management

² Typically derived from the 100’s of global regulations that FS companies must adhere to on cyber security, data protection etc. See this [Worldbank.org](https://www.worldbank.org) link for an overview

Where to start? Find the Right **Partner**

EDB looks at the whole solution...

Looking beyond just the database engine and the ability to get incident support, we shape the **front-to-back database solution** to meet your goals

A Database **Solution** has many components

Service Request / DB Provisioning

DB deployment patterns to match RPO/RT0 reqs.

(Integration) **Compute / Storage**

(Integration) **Identity and Access Management**

Backup / monitoring

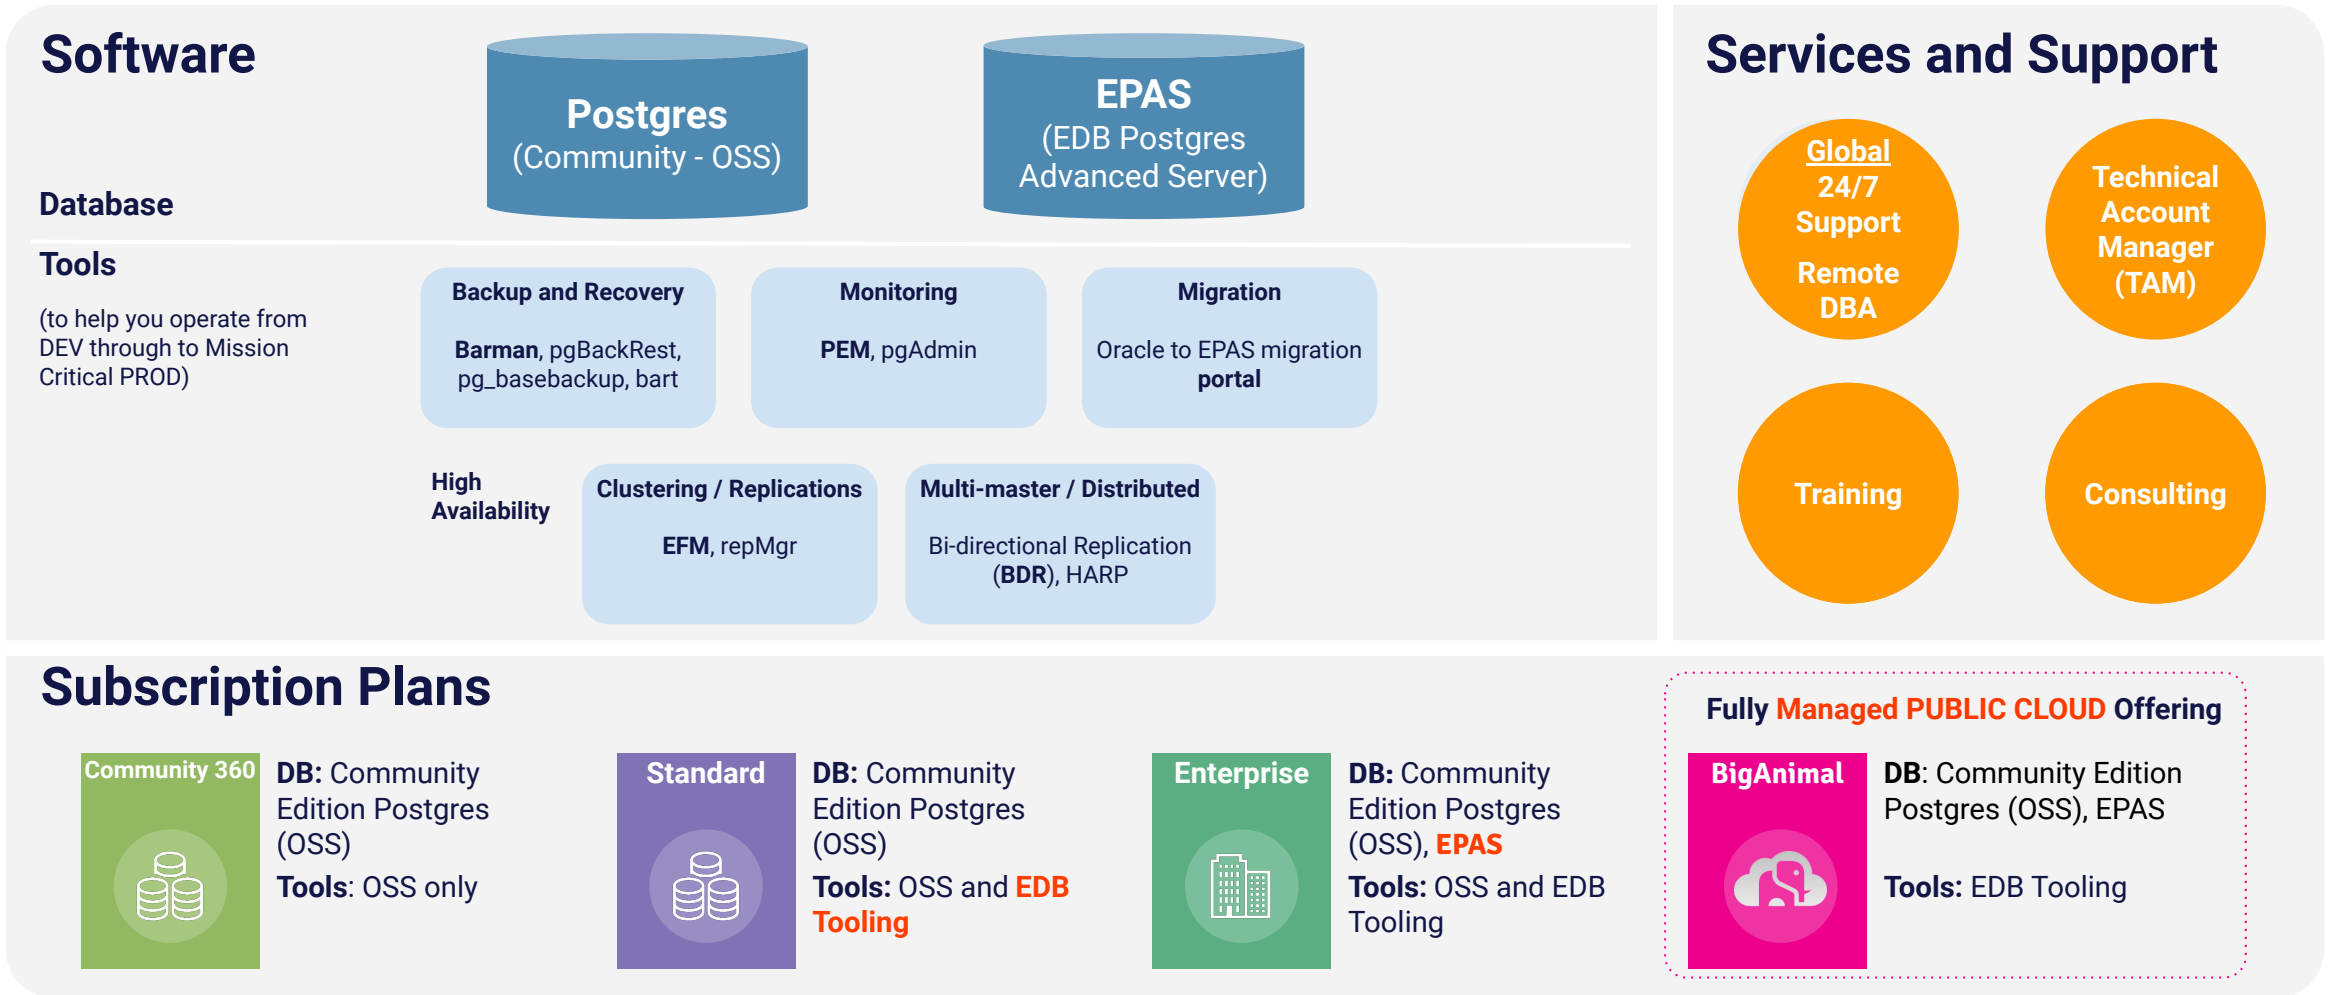

Day to day operations

Patching / Upgrades

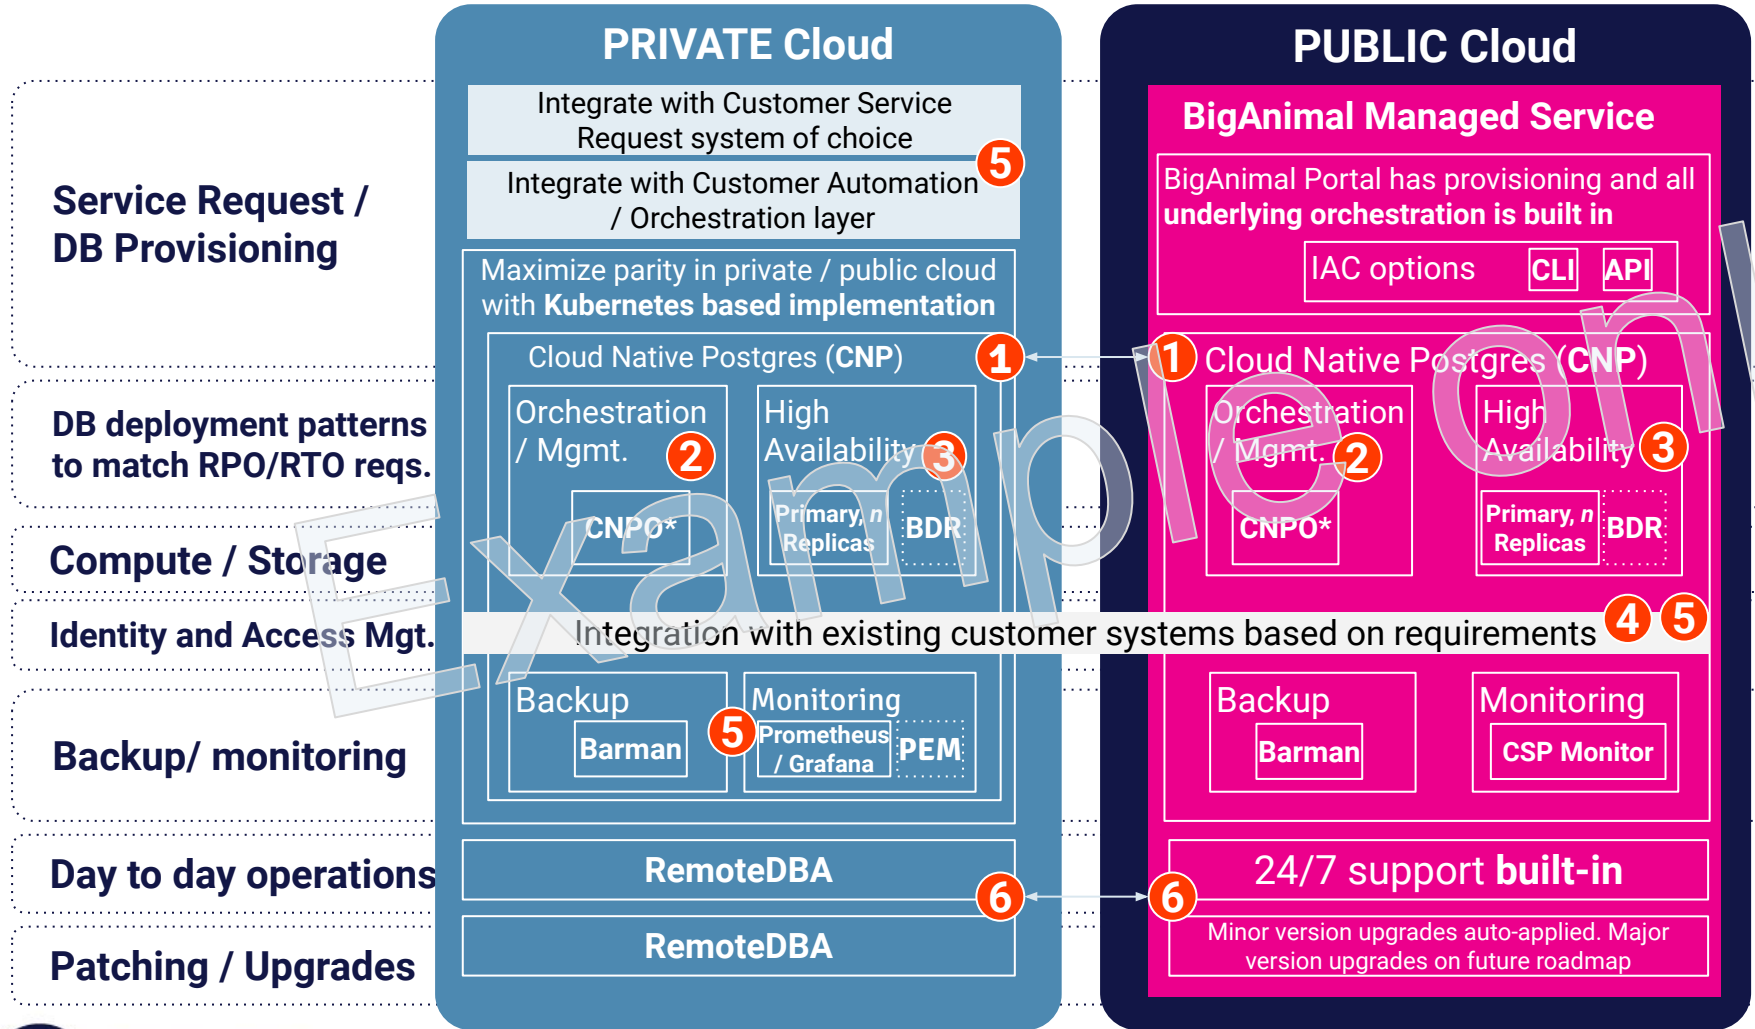

...to develop your **solution journey**

We take a simple **plan, build and run** approach, deploying relevant SMEs at each stage

More Than Just a Database Engine

Example Enterprise Solutions

Mapping to Key Outcomes

- 1** Maximize **parity** between **private and public cloud** with CNPO
- 2** Enable provisioning **automation / consistency + IAC / Devops**
- 3** EDB utilities support different **tiers of service driven by RPO/RTO**. Orchestration enables repeatable deployments
- 4** **Satisfaction** of customer **control obligations**
- 5** **Ecosystem integration** where required
- 6** **Follow the sun** Operational **support** available + **proactive support** for best practices, capacity planning etc.

□ [CNPO \(Cloud native Postgres Operator\)](#) is a Kubernetes Operator we can deploy on premise and is used in our Public Cloud offering

Wrap Up

Postgres in Financial Services Today

- Significant **growth in usage of OSS** generally over last few years
- Financial Services are **no longer hesitant** to embrace
- **Postgres** one of the **leading** OSS technologies
- BUT...there's still a significantly **high bar to manage data** in Financial Services
- Recommend customers **find a strong partner** to work with

Why EDB?

- **Expertise not found elsewhere.**
 - Our [experts](#) have literally contributed to the development + direction of the technology **since its inception**
- We focus on **holistic** database **solutions**
 - We understand the **database ecosystem** and apply best practice to help you meet your goals
- Our **SMEs, tooling** and **deployment flexibility**
 - We **enable** customers to design / deploy / operate Postgres at an **Enterprise level** on platforms of choice
- Deeply **embedded in the community**
 - We actively help drive PostgreSQL **development**
 - We support Postgres **community** continued **success** through conference involvement and education

THANK YOU
